

# Social identity shapes consensus formation in opinion dynamics models

## Social Simulation Conference 2022

- ▶ Peter Steiglechner<sup>1,2</sup>
- ▶ Agostino Merico<sup>1,2</sup>
- ▶ Paul E. Smaldino<sup>3,4</sup>
- ▶ Deyshawn Moser<sup>1,2</sup>
- ▶ Achim Schlüter<sup>1,2</sup>

- 1 Leibniz Centre for Tropical Marine Research (ZMT), Bremen, Germany
- 2 Jacobs University Bremen, Germany
- 3 Department of Cognitive and Information Sciences, University of California, Merced, USA
- 4 Santa Fe Institute, USA

[Young people's] message is clear: the older generation has failed, and it is the young who will pay in full — with their very futures.

– United Nations

[www.un.org/en/climatechange/youth-in-action](http://www.un.org/en/climatechange/youth-in-action)

We young people need to say that we must hold the older generations accountable for the mess they have created [...]

– Greta Thunberg, Fridays for Future  
(2018, CNN Interview)

→ Climate change is social

(Fielding and Hornsey, 2016; Pearson, Schuldt, and Romero-Canyas, 2016)

# Social identity shapes the formation of individual opinions

# Social identity shapes the formation of individual opinions

## Homophily

People tend to interact predominantly with similar others

(McPherson, Smith-Lovin, and Cook, 2001; Fu et al., 2012; Smaldino and Jones, 2021)

# Social identity shapes the formation of individual opinions

## Homophily

People tend to interact predominantly with similar others

(McPherson, Smith-Lovin, and Cook, 2001; Fu et al., 2012; Smaldino and Jones, 2021)

## In-group favouritism bias (here simply 'bias')

People perceive in-group members as more informative than out-group members

(Tajfel, 1974; Hewstone, Rubin, and Willis, 2002; Brewer, 1979)

# Social identity shapes the formation of individual opinions

## Homophily

People tend to interact predominantly with similar others

(McPherson, Smith-Lovin, and Cook, 2001; Fu et al., 2012; Smaldino and Jones, 2021)

## In-group favouritism bias (here simply 'bias')

People perceive in-group members as more informative than out-group members

(Tajfel, 1974; Hewstone, Rubin, and Willis, 2002; Brewer, 1979)

- How do these processes affect consensus formation?

People perceive in-group members as more informative than out-group members

(Tajfel, 1974; Hewstone, Rubin, and Willis, 2002; Brewer, 1979)

- ▶ How do these processes affect consensus formation?
- ▶ Enter opinion formation models
- ▶ But socio-psychological dimensions often neglected

(Sobkowicz, 2020; Galesic et al., 2021)

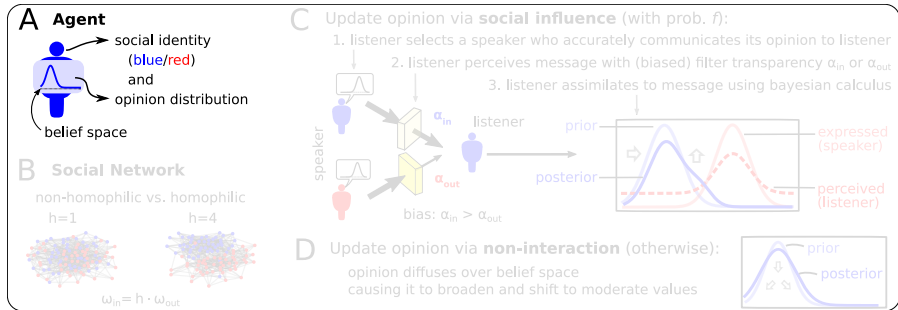

# Research agenda

- ▶ Develop an opinion formation model including social identity and related socio-psychological individual processes.
- ▶ How do homophily and in-group favouritism bias affect
  1. *whether* consensus forms in general?
  2. *how fast* consensus forms?

# Model

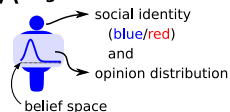

## Model

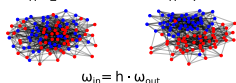

# Model

## A Agent

## B Social Network

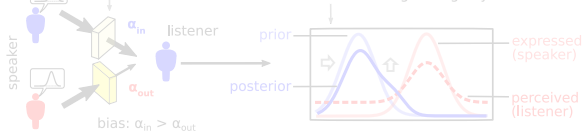

non-homophilic vs. homophilic  
 $h=1$        $h=4$

## C

Update opinion via **social influence** (with prob.  $f$ ):

1. listener selects a speaker who accurately communicates its opinion to listener
2. listener perceives message with (biased) filter transparency  $\alpha_{in}$  or  $\alpha_{out}$
3. listener assimilates to message using bayesian calculus

## D

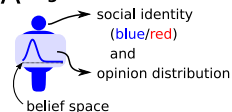

Update opinion via **non-interaction** (otherwise):

opinion diffuses over belief space  
causing it to broaden and shift to moderate values

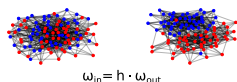

# Model

## A Agent

## B Social Network

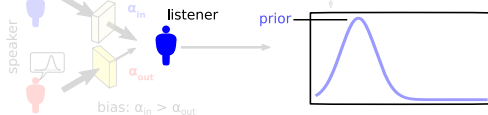

non-homophilic vs. homophilic  
 $h=1$   $h=4$

## C

Update opinion via **social influence** (with prob.  $f$ ):

1. listener selects a speaker who accurately communicates its opinion to listener
2. listener perceives message with (biased) filter transparency  $\alpha_{in}$  or  $\alpha_{out}$
3. listener assimilates to message using bayesian calculus

## D

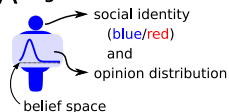

Update opinion via **non-interaction** (otherwise):

opinion diffuses over belief space causing it to broaden and shift to moderate values

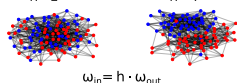

# Model

non-homophilic vs. homophilic

$h=1$

$h=4$

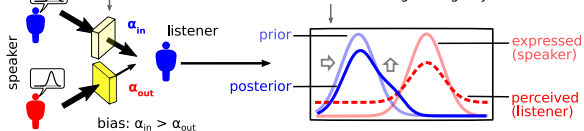

$$\omega_{in} = h \cdot \omega_{out}$$

## C

Update opinion via **social influence** (with prob.  $f$ ):

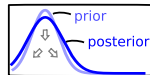

1. listener selects a speaker who accurately communicates its opinion to listener
2. listener perceives message with (biased) filter transparency  $\alpha_{in}$  or  $\alpha_{out}$
3. listener assimilates to message using bayesian calculus

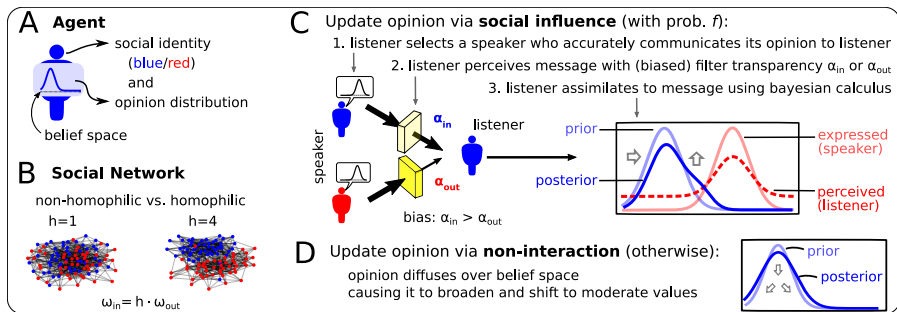

## D

Update opinion via **non-interaction** (otherwise):

opinion diffuses over belief space causing it to broaden and shift to moderate values

# Model

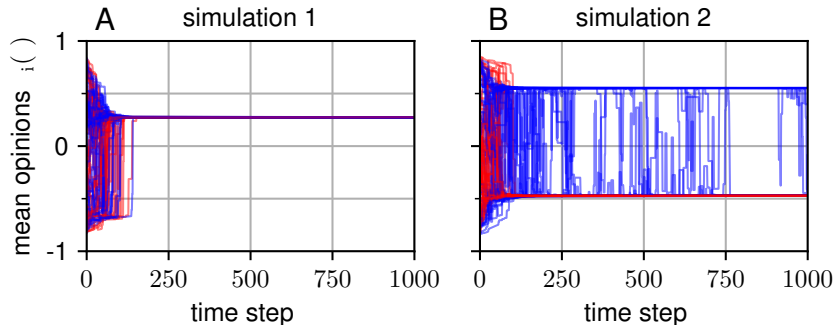

Initialise agents:

- ▶ Social identities are blue/red; groups are evenly sized.
- ▶ Opinions are gaussian with fixed width and random mean

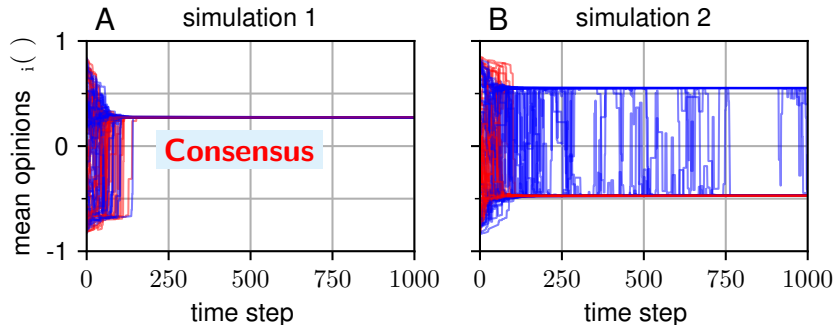

# Results I

Society with fixed bias ( $\alpha_{\text{in}} = 0.8$ ,  $\alpha_{\text{out}} = 0.3$ ) and fixed homophily ( $h = 4$ )

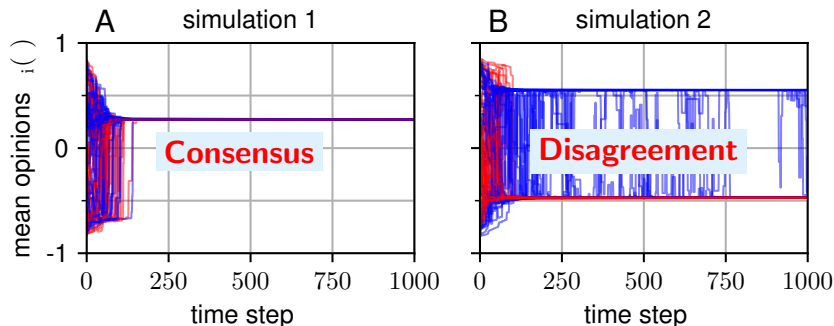

# Results I

Society with fixed bias ( $\alpha_{\text{in}} = 0.8$ ,  $\alpha_{\text{out}} = 0.3$ ) and fixed homophily ( $h = 4$ )

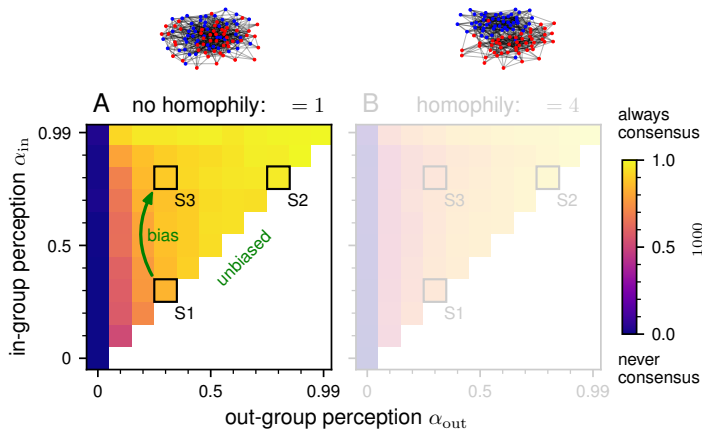

# Results I

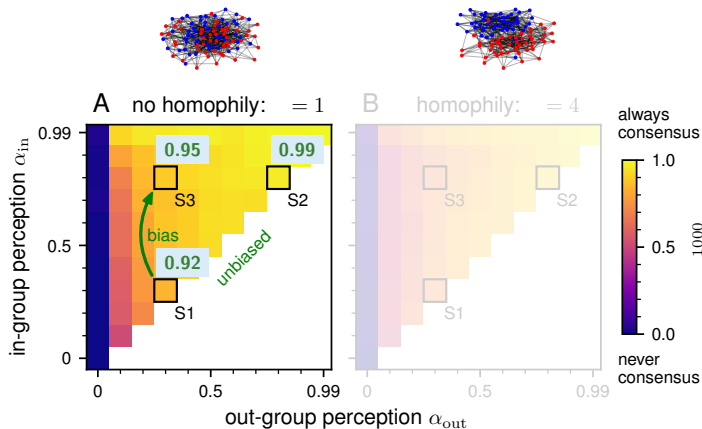

Society with fixed bias ( $\alpha_{\text{in}} = 0.8$ ,  $\alpha_{\text{out}} = 0.3$ ) and fixed homophily ( $h = 4$ )

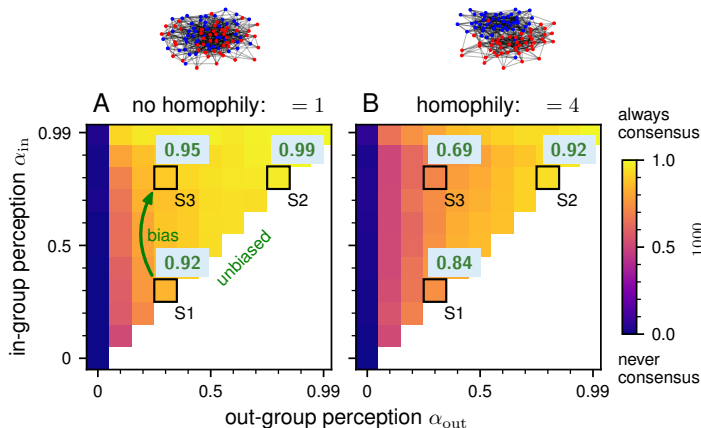

# Results II

## Results II

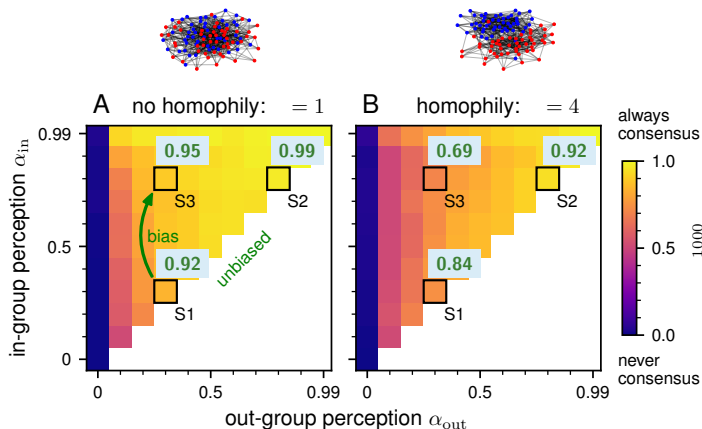

## Results II

► Homophily & bias combined impede consensus in a society ...

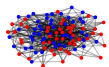

## Results II

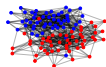

- ▶ Homophily & bias combined impede consensus in a society ...
- ▶ ... but sometimes they *accelerate* consensus formation

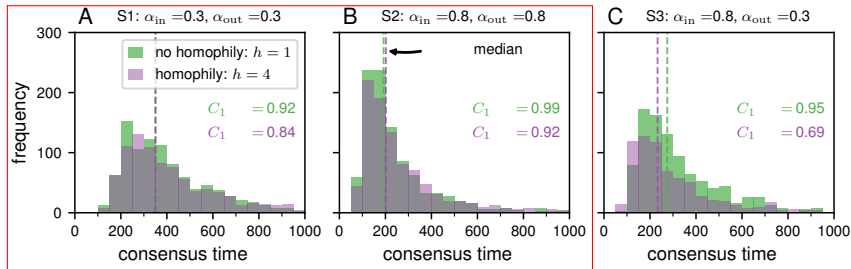

## Results II

→ non-homophilic  $h = 1$

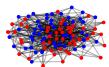

→ homophilic  $h = 4$

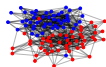

- ▶ Homophily & bias combined impede consensus in a society ...
- ▶ ... but sometimes they *accelerate* consensus formation

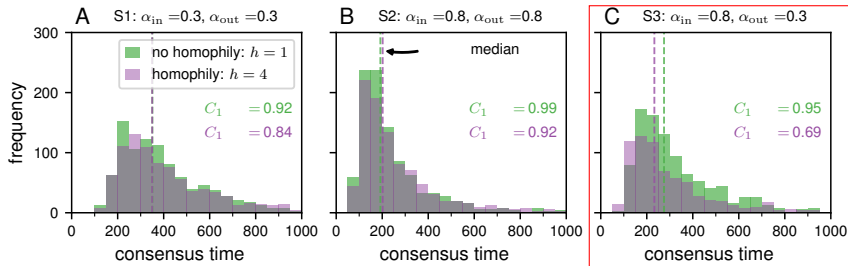

## Results II

→ non-homophilic  $h = 1$

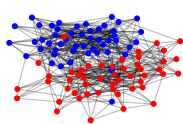

→ homophilic  $h = 4$

- ▶ ... but sometimes they *accelerate* consensus formation

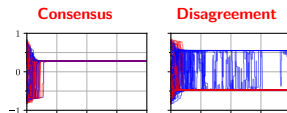

# Summing up

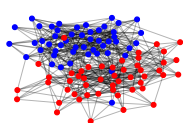

homophily

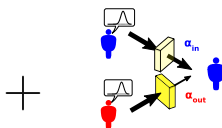

in-group favouritism bias

# Summing up

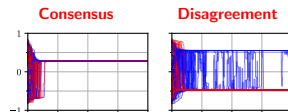

homophily

in-group favoritism bias

ABM

We young people need to say that we must hold the older generations accountable for the mess they have created [ . . . ]

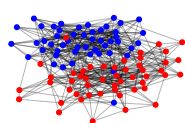

– Greta Thunberg, Fridays for Future

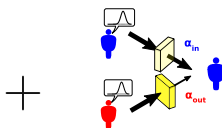

When social identity is relevant in a public debate

- ▶ it negatively affects consensus formation in general
- ▶ it may nevertheless sometimes facilitate *fast* consensus

# Summing up

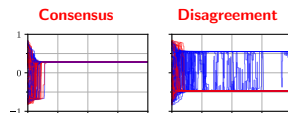

homophily

in-group favouritism bias

ABM

We young people need to say that we must hold the older generations accountable for the mess they have created [ . . . ]

– Greta Thunberg, Fridays for Future

When social identity is relevant in a public debate

- ▶ it negatively affects consensus formation in general
- ▶ it may nevertheless sometimes facilitate *fast* consensus

→ Is highlighting social identity (young vs. old generation) in the debate on climate change useful in accelerating consensus?

# Update rule

- ▶ Opinion of agent  $i$ :  $x_i(b, t)$ , where  $b \in \mathcal{B}$  belief space  $\mathcal{B}$ .
- ▶ Perception of the opinion of a speaker  $j$ :

$$p_i(x_j(b, t)) = \alpha_i(j) \cdot x_j(b, t) + (1 - \alpha_i(j)) \cdot \mathcal{U}(b) ,$$

where  $\alpha_i(j)$  is  $\alpha_{\text{in}}$  if  $i$  and speaker  $j$  are in-group members and  $\alpha_{\text{out}}$  else.  $\mathcal{U}$  is the uniform distribution.

- ▶ Update rule after interaction (before normalisation):

$$x_i(b, t + 1) \sim x_i(b, t) \cdot p_i(x_j(b, t))$$

- ▶ Update during non-interaction (diffusion):

$$\text{integrate for one time step : } \frac{d}{dt} x_i(b, t) = \kappa \cdot \frac{d^2}{db^2} x_i(b, t)$$

# Parameters

**Table:** Model parameters and the default values.

Parameter	Description	Value
$N$	nr. of agents	100
$k$	average node degree of an agent	10
$S$	nr. of social identities (here, evenly sized groups)	2
$\mathcal{B}$	belief space	$\{-0.995, -0.985, \dots, 0.995\}$
$f$	frequency of an agent to interact (listen) in a time step	0.2
$\kappa$	diffusion constant of the opinion distribution, when the agent does not interact	0.0002
$\sigma_0$	variance of initial gaussian opinion distributions for all agents	0.2
$h$	level of homophily in the network	1 (no homophily), 4 (homophily)
$\alpha_{\text{in}}$	perceived informativeness of in-group member	$\in [0, 1[$
$\alpha_{\text{out}}$	perceived informativeness of out-group agent	$\in [0, 1[$
$\sigma_{\text{cons}}$	threshold of the standard deviation of agent mean opinions that defines consensus at time $\tau$ ( $\sigma = \frac{1}{N} \cdot \left( \sum_{i \in \{1 \dots N\}} (b_i(\tau) - \bar{b}(\tau))^2 \right)^{0.5} < \sigma_{\text{cons}}$ )	0.01
